EPD STANDARDS, SCOPE AND VERIFICATION

Program operator	EPD Hub, hub@epdhub.com
Reference standard	EN 15804:2012+A2:2019/AC:2021 and ISO 14025
PCR	EPD Hub Core PCR Version 1.2, 24 Mar 2025
Sector	Construction product
Category of EPD	Third party verified EPD
Scope of the EPD	Cradle to gate with options, A4-A5, and modules C1-C4, D
EPD author	Christopher Dahl, Smart Tactiles AS
EPD verification	Independent verification of this EPD and data, according to ISO 14025: ☐ Internal verification ☒ External verification
EPD verifier	Vera Durão, as an authorised verifier acting for EPD Hub Limited

This EPD is intended for business-to-business and/or business-to-consumer communication. The manufacturer has the sole ownership, liability, and responsibility for the EPD. EPDs within the same product category but from different programs may not be comparable. EPDs of construction products may not be comparable if they do not comply with EN 15804 and if they are not compared in a building context.

PRODUCT

Product name	Composite Tactile Indicators
Additional labels	N/A
Product reference	Smart Tactiles
Place(s) of raw material origin	USA and China
Place of production	Province of Zhejiang, China
Place(s) of installation and use	Norway, Sweden, Denmark, Finland, Iceland and beyond
Period for data	01/01/2024 - 31/12/2024
Averaging in EPD	No grouping
Variation in GWP-fossil for A1-A3 (%)	-

Net freshwater use, A1-A3 (m ³)	0,18

PRODUCT AND MANUFACTURER

ABOUT THE MANUFACTURER

About Smart Tactiles AS

Smart Tactiles AS is a Norwegian distributor specializing in composite tactile indicators and universal design products which enhance accessibility for blind and visually impaired people. Our tactile systems in composite are engineered for durability, strong adhesion and long service life, complying with ISO 23599:2019, EN 17210:2021, CEN/TR 17621:2021, BS 8300-2:2018, AS/NZS 1428.4.1:2021, JIS T 9251:2022, NS11001, NS11005 and TEK17 standards for safe and inclusive navigation in public and private spaces.

In addition to composite indicators, we provide tactile indicators in different metals, tiles and signage as well as stair nosing - all designed to improve orientation, safety and visual contrast. This also includes outdoor tactile products.

Smart Tactiles AS integrates sustainability and transparency across its operations, documenting environmental performance through Environmental Product Declarations (EPDs) and prioritising recyclable materials and low-waste production.

Through technical innovation and collaboration with architects and contractors, we contribute to safer, more inclusive and universally designed environments across Scandinavia and beyond.

PRODUCT DESCRIPTION

Product Description

Smart Tactiles tactile indicators in composite are surface-mounted guidance and warning elements designed to provide orientation and safety for blind

and visually impaired users.

The indicators are made from glass-fibre reinforced composite material combining high mechanical strength with low weight and excellent wear resistance.

Each tactile unit is coloured throughout the material for long-term UV stability and visual contrast. The system is delivered with a pre-applied 3M VHB5952 adhesive for fast and durable installations on most indoor and several outdoor surfaces.

Products are available in different designs, sizes and colour variants to meet national and international accessibility standards.

Product Application

The composite tactile indicators are used as part of universal design and accessibility solutions in public and private buildings, transport terminals, stations and outdoor walkways.

They are applied to mark guiding lines, warning fields and decision points to assist navigation for people with visual impairments.

Typical applications include entrances, stairways, ramps, platform edges, receptions and circulation areas.

The system can be installed on concrete, ceramic, vinyl, wood or stone surfaces and is suitable for both new construction and retrofit projects.

Technical Characteristics:

Property:	Description:
Material:	Glass-fibre reinforced polymer (composite) Zytel® PA66 + 13% glass fibre
Dimensions/weight	
per individual indicator:	Stud Ø32mm/2,35gr, Rib-13 cm/14,1gr, Rib 28 cm/30,4 gr

Property:	Description:
Thickness:	3,7 mm
Colour:	Integral pigmentation (various RAL options)
Adhesive:	3M VHB5952 high-bond acrylic adhesive tape
Surface finish:	Anti-slip textured on smooth matt finish
Temperature resistance:	-40 °C to +80 °C
UV resistance:	High (tested for outdoor use)
Slip resistance:	R10-11 (DIN 51130) depending on surface type
Expected service life:	> 10 years under normal conditions
Maintenance:	Periodic cleaning with neutral detergent; no repainting required
End-of-life:	Mechanically separable and recyclable as composite fraction
REACH materials:	Zytel® PA66 + 13% glass fibre is REACH compliant and contains no SVHCs.

Further information can be found at:

www.smarttactiles.com

PRODUCT RAW MATERIAL MAIN COMPOSITION

Raw material category	Amount, mass %	Material origin
Metals	0 %	None – no metallic content in composite indicators
Minerals	10,7%	USA
Fossil materials	89,3 %	USA and China
Bio-based materials	0 %	None

BIOGENIC CARBON CONTENT

Product's biogenic carbon content at the factory gate

Biogenic carbon content in product, kg C	0
Biogenic carbon content in packaging, kg C	0,019

PRODUCT LIFE-CYCLE

SYSTEM BOUNDARY

This EPD covers the life-cycle modules listed in the following table.

Product stage			Assembly stage		Use stage							End of life stage				Beyond the system boundaries		
A1	A2	A3	A4	A5	B1	B2	B3	B4	B5	B6	B7	C1	C2	C3	C4	D		
x	x	x	x	x	ND	ND	ND	ND	ND	ND	ND	x	x	x	x	x		
Raw materials	Transport	Manufacturing	Transport	Assembly	Use	Maintenance	Repair	Replacement	Refurbishment	Operational energy use	Operational water use	Deconstruction/ demolition	Transport	Waste processing	Disposal	Reuse	Recovery	Recycling

Not declared = ND.

MANUFACTURING AND PACKAGING (A1-A3)

The environmental impacts considered for the product stage cover the manufacturing of raw materials used in the production as well as packaging materials and other ancillary materials. Also, fuels used by machines, and handling of waste formed in the production processes at the manufacturing facilities are included in this stage. The study also considers the material losses occurring during the manufacturing processes as well as losses during electricity transmission.

A market-based approach is used in modelling the electricity mix utilized in the factory. The supply of electricity comes from local grid. Chinese factories in south east part of China have no heating in factories.

The manufacturing process begins with mixing organic paint pigment with the DuPont PA66 material. It is then heated up in molds shaped for each individual product and melted together to form the correct shape with one continuous color.

After cooling off, the 3M VHB5952 adhesive double-sided tape is applied.

Once finished, the products undergo final inspection and are packaged for distribution.

The finished products are shipped from our factory in the province of Zhejiang, China to our main warehouse in Oslo, Norway by container ship. Upon arrival at our warehouse in Oslo, the tactile indicators are stored on shelves and remain in their boxes until sold to customers.

In terms of waste management, the handling of additional materials is integrated into the A3 stage of manufacturing waste processing. For each declared unit produced, approximately ,05% plastic waste is generated. This waste is collected and transported to a waste management facility located 5 km from the manufacturing site.

The finished products are firstly packed in thin plastic bag, secondly in corrugated cardboard boxes and finally stacked on pallets for shipment to our warehouse in Oslo, Norway. Freight is transported by sea in shipping containers.

Raw materials are coming from the US and transported to China. The distance is assumed to be between 12250 km using lorry and sea transportation on bulk ships. The finished products are transported 20250 km from China to Norway using a combination of both lorry and ship container transport.

Waste that is included in A3 is production losses from the Zytel® PA66 + 13% glass fibre material and in the packaging materials from China. Treatment of production losses is assumed to follow a conservative approach and is modelled as an incineration without energy recovery.

Cardboard packaging waste is treated according to an average EoL scenario from Eurostat. The wooden packaging was treated using a global EoL scenario from business waste of UK.

The use of green energy in manufacturing is demonstrated through contractual instruments (GOs, RECs, etc.), and its use is ensured throughout the validity period of this EPD.

TRANSPORT AND INSTALLATION (A4-A5)

Transportation impacts occurred from final products delivery to construction sites (A4) and other customers cover fuel direct exhaust emissions, environmental impacts of fuel production, as well as related infrastructure emissions.

Customer orders whether from across the Nordic region (Norway, Sweden, Denmark, Finland and Iceland) or directly from construction projects are fulfilled by repacking materials into smaller quantities using corrugated cardboard boxes and then shipped to the respective sites. In addition to deliveries, orders are often picked up directly by end-customers at our warehouse.

Our warehouse maintains a large inventory of materials to ensure availability at all times. Approximately one-third of all orders are shipped via local transportation companies, another third is delivered by our own fleet within the local area and the remaining third are collected directly from the warehouse by customers. We have calculated that on average the transportation distance for an order is 78,5 km. Most deliveries are made using electric vehicles, aligning with our sustainability goals. The transportation process does not result in any material losses.

There are no installation losses during the installation in A5. The waste in A5 is mainly packaging materials from our warehouse in Oslo. The waste processing plant site is located 5 km from our warehouse.

PRODUCT USE AND MAINTENANCE (B1-B7)

The use phase is not relevant for the life cycle emissions of this product and is, therefore, not accounted into the assessment.
Air, soil and water impacts during the use phase have not been studied.

PRODUCT END OF LIFE (C1-C4, D)

In C1 (deconstruction), tactile indicators are removed manually or with minimal mechanical support.

In C2 (transport), dismantled indicators are transported to local waste treatment or recycling facilities by electrical van for a distance of 20 km. During C3 (waste processing), it is assumed that 87 % of the product is plastic and 13% is treated as glass fibre.

For waste treatment and EoL of PA66 an average scenario for Europe has been chosen according to Plastics Europe 2020. It is assumed that 24% of the product goes to recycling, 49% incineration with energy recovery.

In Module C4 (disposal), according to Plastics Europe (2020), 27% of the plastic is assumed to be landfilled. For glass fibre, a conservative approach has been adopted, assuming that 100% is landfilled.

EoL of these products are in Norway as the EoL scenario is representative of waste treatment scenarios in Norway.

Module D accounts for the benefits and loads associated with material recovery and recycling at the end of life. It includes scenarios for plastics and cardboard packaging. The loads are represented by the energy used for recycling the waste materials, while the benefits are represented by the avoided production of new materials.

For cardboard and plastic packaging, benefits from recycling have been taken into account, as well as benefits from energy recovery through incineration. The incineration process is assumed to have a total fuel efficiency of 38%, with 16% allocated to electricity generation and 22% to heat. Energy use during the recycling of cardboard and plastic packaging has been included as a load, and transfers of renewable and non-renewable energy contained in the materials have also been accounted for. Similarly, for the main product, benefits have been taken into account for the recycling of PA66, including the avoided production of new raw material and transfer of non-renewable energy as material. The load associated with recycling consists of the energy use associated with the recycling process. For the portion of the raw material that is incinerated, benefits from energy recovery have been accounted for, with allocation to both heat and electricity generation.

MANUFACTURING PROCESS

Smart Tactiles AS, Oslo, Norway - Life-cycle diagram EPD

LIFE-CYCLE ASSESSMENT

CUT-OFF CRITERIA

The study does not exclude any modules or processes which are stated mandatory in the reference standard and the applied PCR. The study does not exclude any hazardous materials or substances. The study includes all major raw material and energy consumption. All inputs and outputs of the unit processes, for which data is available for, are included in the calculation. There is no neglected unit process more than 1% of total mass or energy flows. The module specific total neglected input and output flows also do not exceed 5% of energy usage or mass.

The production of capital equipment, construction activities, and infrastructure, maintenance and operation of capital equipment, personnel-related activities, energy and water use related to company management and sales activities are excluded.

This LCA study includes the provision of all materials, transportation, energy and emission flows, and end of life processing of product. The use phase is not covered, assuming there are no use emissions or replacements. All industrial processes from raw material acquisition and pre-processing, production, product distribution and installation, use and end-of-life management are included. The production of capital equipment, construction activities, and infrastructure, maintenance and operation of capital equipment, personnel-related activities, energy and water use related to company management and sales activities are excluded.

VALIDATION OF DATA

Data collection for production, transport, and packaging was conducted using time and site-specific information, as defined in the general information section on page 1 and 2. Upstream process calculations rely on generic data as defined in the Bibliography section. Manufacturer-provided specific and generic data were used for the product's manufacturing stage. The analysis was performed in One Click LCA EPD Generator, with the 'Cut-Off, EN 15804+A2' allocation method, and characterization factors according to EN 15804:2012+A2:2019/AC:2021 and JRC EF 3.1.

ALLOCATION, ESTIMATES AND ASSUMPTIONS

Allocation is required if some material, energy, and waste data cannot be measured separately for the product under investigation. All allocations are done as per the reference standards and the applied PCR. In this study, allocation has been done in the following ways:

Data type	Allocation
Raw materials	Allocated by mass or volume
Packaging material	Allocated by mass or volume
Ancillary materials	Not applicable
Manufacturing energy and waste	Allocated by mass or volume

All estimations and assumptions regarding the cut off criteria and the allocation are declared in the part "Cut-off Criteria except the estimations/assumptions below: - Module A3: Proxy data is used for certain materials during their absence from the database such as PA6.6

incineration.- Module A2, A4 & C2: Vehicle capacity utilization volume factor is assumed to be 1 which means full load. It may vary but as the role of transportation emission in total results is small, the variety in load is assumed to be negligible. Empty returns are included as an average load factor in the ecoinvent database. Transport distances for waste transportation were assumed to be within 50 km radius- Module A4: Transportation does not cause losses as products are packaged properly. Also, volume capacity utilization factor is assumed to be 1 for the nested packaged products. Additionally, transportation distances are assumed based on an average of deliveries locally, regionally, nationally and in the Nordics minus pick-up orders from our warehouse in Oslo. We have calculated that on average the transportation distance for an order is 78,5 km.

LCA SOFTWARE AND BIBLIOGRAPHY

This EPD has been created using One Click LCA EPD Generator for EPD Hub V3 and EPD Process Certification v3.2.3. The LCA and EPD have been prepared according to the reference standards and ISO 14040/14044. The EPD Generator uses Ecoinvent v3.10.1/3.11 and One Click LCA databases as sources of environmental data. Allocation used in Ecoinvent 3.10.1/3.11 environmental data sources follow the methodology 'allocation, Cut-off, EN 15804+A2'.

End-of-life scenario of main product considers statistics from Plastics Europe (2022) - https://plasticseurope.org/wp-content/uploads/2021/10/BC_Table.pdf: - recycling rate - 24% - incineration with energy recovery - 49% - landfill - 27%.

Average World scenario for wooden packaging waste. 15% recycled <https://www.businesswaste.co.uk/your-waste/waste-wood-collection/wood-recycling-facts-and-statistics/> Rest of wood is assumed to be landfilled given lack of data, although some if likely incinerated for energy.

Average EU scenario for cardboard and plastic packaging treatment scenario according to Eurostats https://ec.europa.eu/eurostat/databrowser/view/env_waspac__custom_8519259/default/table?lang=en

ENVIRONMENTAL IMPACT DATA

The estimated impact results are only relative statements which do not indicate the end points of the impact categories, exceeding threshold values, safety margins or risks.

ADDITIONAL INDICATOR – GWP-GHG

Impact category	Unit	A1	A2	A3	A1-A3	A4	A5	B1	B2	B3	B4	B5	B6	B7	C1	C2	C3	C4	D
GWP-GHG ⁹⁾	kg CO ₂ e	6,26E+00	1,52E-01	2,46E+00	8,87E+00	1,70E-01	1,13E-02	ND	ND	ND	ND	ND	ND	ND	0,00E+00	2,38E-03	1,37E+00	2,84E-02	-1,08E+00

9) This indicator includes all greenhouse gases excluding biogenic carbon dioxide uptake and emissions and biogenic carbon stored in the product. In addition, the characterisation factors for the flows – CH₄ fossil, CH₄ biogenic and Dinitrogen monoxide – were updated. This indicator is identical to the GWP-total of EN 15804:2012+A2:2019 except that the characterisation factor for biogenic CO₂ is set to zero.

SCENARIO DOCUMENTATION

Manufacturing energy scenario documentation

Scenario parameter	Value
Electricity data source and quality	Grid electricity in China and Norway, medium voltage China: Electricity, consumption mix w/o renewables, China Norway: Electricity, medium voltage, residual mix (Reference product: electricity, medium voltage)
Electricity CO2e / kWh	1,15 0,73

Transport scenario documentation A4

Scenario parameter	Value
Fuel type, consumption, and vehicle type. Eg, electric truck, diesel powered truck	Transport, freight, light commercial vehicle
Average transport distance, km	78,5
Capacity utilization (including empty return) %	50
Bulk density of transported products	-
Volume capacity utilization factor	1

Installation scenario documentation A5

Scenario information	Value
Ancillary materials for installation (specified by material) / kg or other units as appropriate	-
Water use / m ³	-
Other resource use / kg	-
Quantitative description of energy type (regional mix) and consumption during the installation process / kWh or MJ	-
Waste materials on the building site before waste processing, generated by the product's installation (specified by type) / kg	Cardboard: 0,017782 kg Plastic: 0,008926 kg
Output materials (specified by type) as result of waste processing at the building site e.g. collection for recycling, for energy recovery, disposal (specified by route) / kg	% are for recycling, incinerated w. energy recovery, landfill respectively. Cardboard: 83%, 8%, 9% Plastic: 40%, 37%, 23%
Direct emissions to ambient air, soil and water / kg	-

End of life scenario documentation - C1-C4

Scenario information	Value
Collection process – kg collected separately	0
Collection process – kg collected with mixed waste	Tactile Indicator: 1 kg
Recovery process – kg for re-use	0
Recovery process – kg for recycling	PA66: 0,21 kg
Recovery process – kg for energy recovery	PA66: 0,43 kg
Disposal (total) – kg for final deposition	PA66: 0,23 kg Glass fibre: 0,13 kg
Scenario assumptions e.g. transportation	20 km transport by truck to local recycling station/landfill

THIRD-PARTY VERIFICATION STATEMENT

EPD Hub declares that this EPD is verified in accordance with ISO 14025 by an independent, third-party verifier. The project report on the Life Cycle Assessment and the report(s) on features of environmental relevance are filed at EPD Hub. EPD Hub PCR and ECO Platform verification checklist are used.

EPD Hub is not able to identify any unjustified deviations from the PCR and EN 15804+A2 in the Environmental Product Declaration and its project report.

EPD Hub maintains its independence as a third-party body; it was not involved in the execution of the LCA or in the development of the declaration and has no conflicts of interest regarding this verification.

The company-specific data and upstream and downstream data have been examined as regards plausibility and consistency. The publisher is responsible for ensuring the factual integrity and legal compliance of this declaration.

The software used in creation of this LCA and EPD is verified by EPD Hub to conform to the procedural and methodological requirements outlined in ISO 14025:2010, ISO 14040/14044, EN 15804+A2, and EPD Hub Core Product Category Rules and General Program Instructions.

Verified tools

Tool verifier: Magaly Gonzalez Vazquez

Tool verification validity: 27 March 2025 - 26 March 2028

Vera Durão, as an authorised verifier acting for EPD Hub Limited
